

# Speaking Through Policies

# Personas

Infra Provider

Hi, I'm Ian

Cluster Operator

I'm Chihiro

App Developer

I'm Ana

# Ana: App Developer

I work with Chihiro at Evil Genius Cupcakes, where I am an **App Developer**.

My team **writes, deploys and maintains** software on **Kubernetes**, that the employees of our company use to operate the production of cupcakes.

Recently, I worked on the latest version of our “baker” **service**, which is ready to be deployed to **staging**.

# Chihiro: Cluster Operator (aka Platform Engineer)

I work with Ana at **Evil Genius Cupcakes**  
My team **maintains** the **platform** where Ana  
**deploys** her apps.

We set up **ingress gateways** that route the  
traffic to the services.

We configure the top connectivity and  
**security** of the gateways (e.g.: **DNS**, **TLS**  
**certs**, etc).

We also ensure that some company-level  
**policies** are being **enforced**.

# Ian: Infrastructure Provider

I work for the company “Infra 4 bakers”  
providing **K8S** clusters with batteries  
included, ready for their use. Including  
**Gateway API** and **Kuadrant**

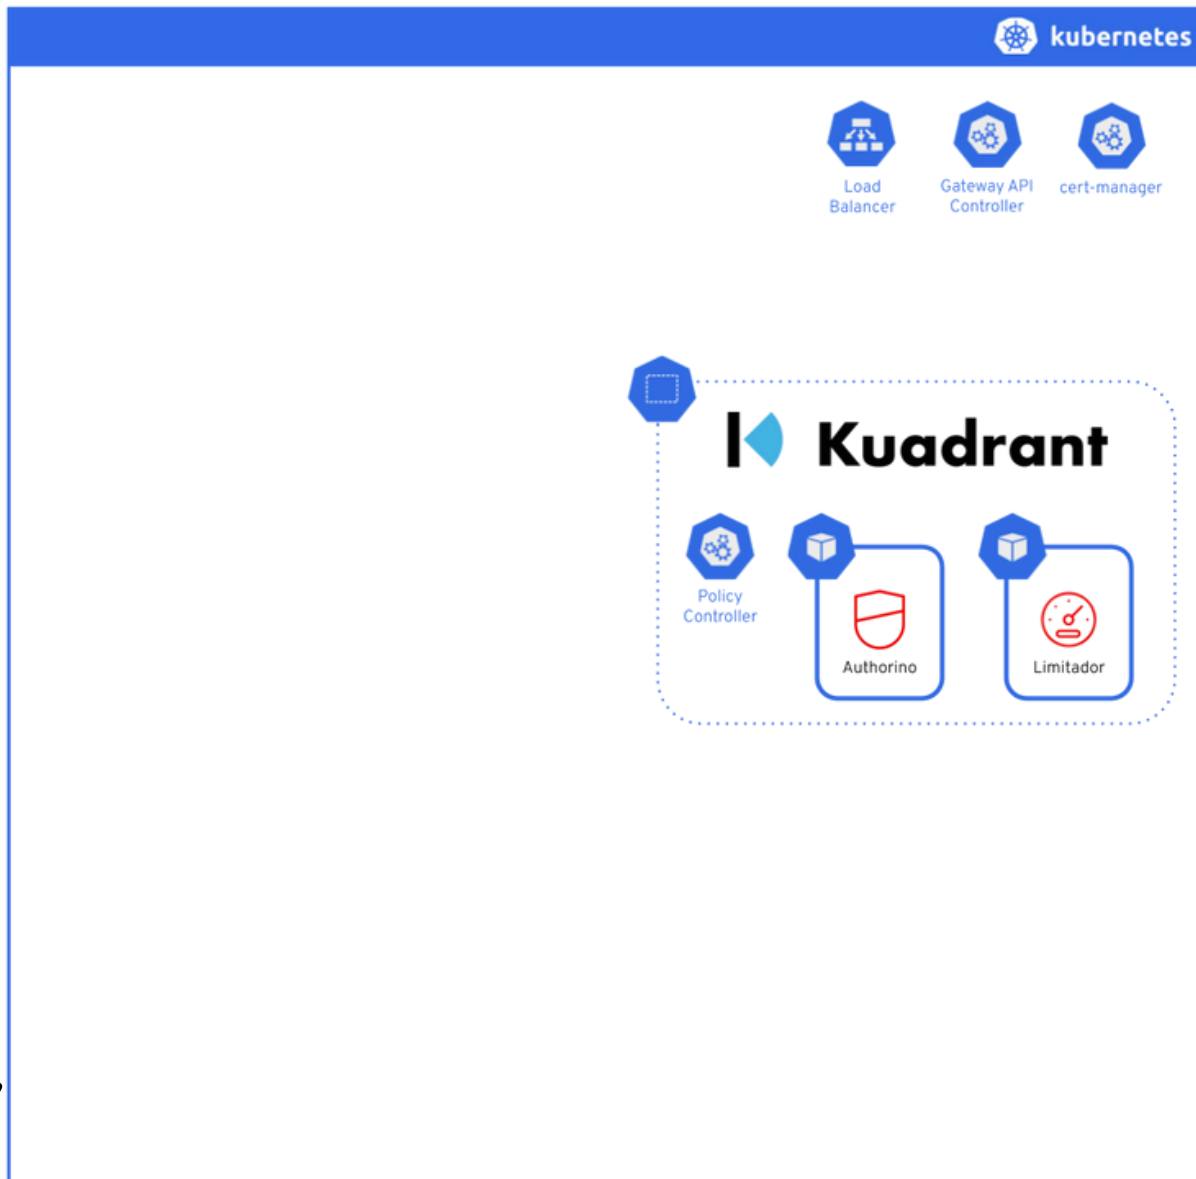

Oh, and I don't know who  
those other two people are

# Cluster Ready

Our Infrastructure provider, Ian, span up this cluster for us and installed a **gateway controller** in advance.

# Deploy Baker Service

My work depends on Chiriro's a little, because the **gateways must be there**, but once they are, we're very **autonomous** regarding how we **deploy** the apps and **roll out new versions**.

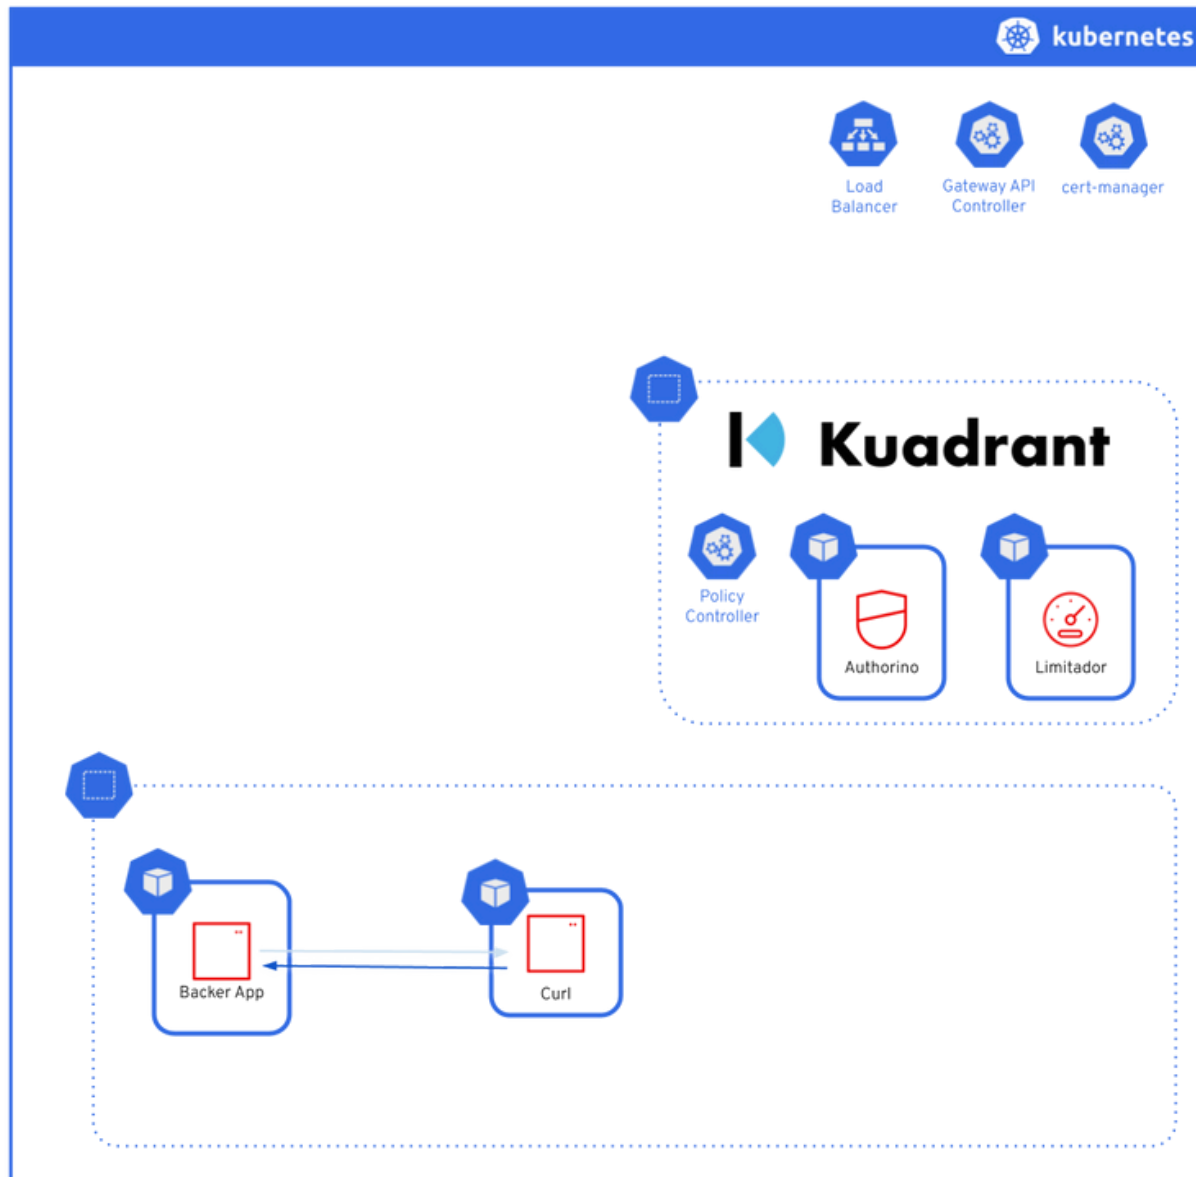

We have a **namespace** where we configure the apps.

This is typically done via automation integrated with our code repositories, but today I will be demoing my day-to-day using the **kubectl CLI** tool.

In fact, I am about to **deploy** the **`baker` service** I mentioned before.

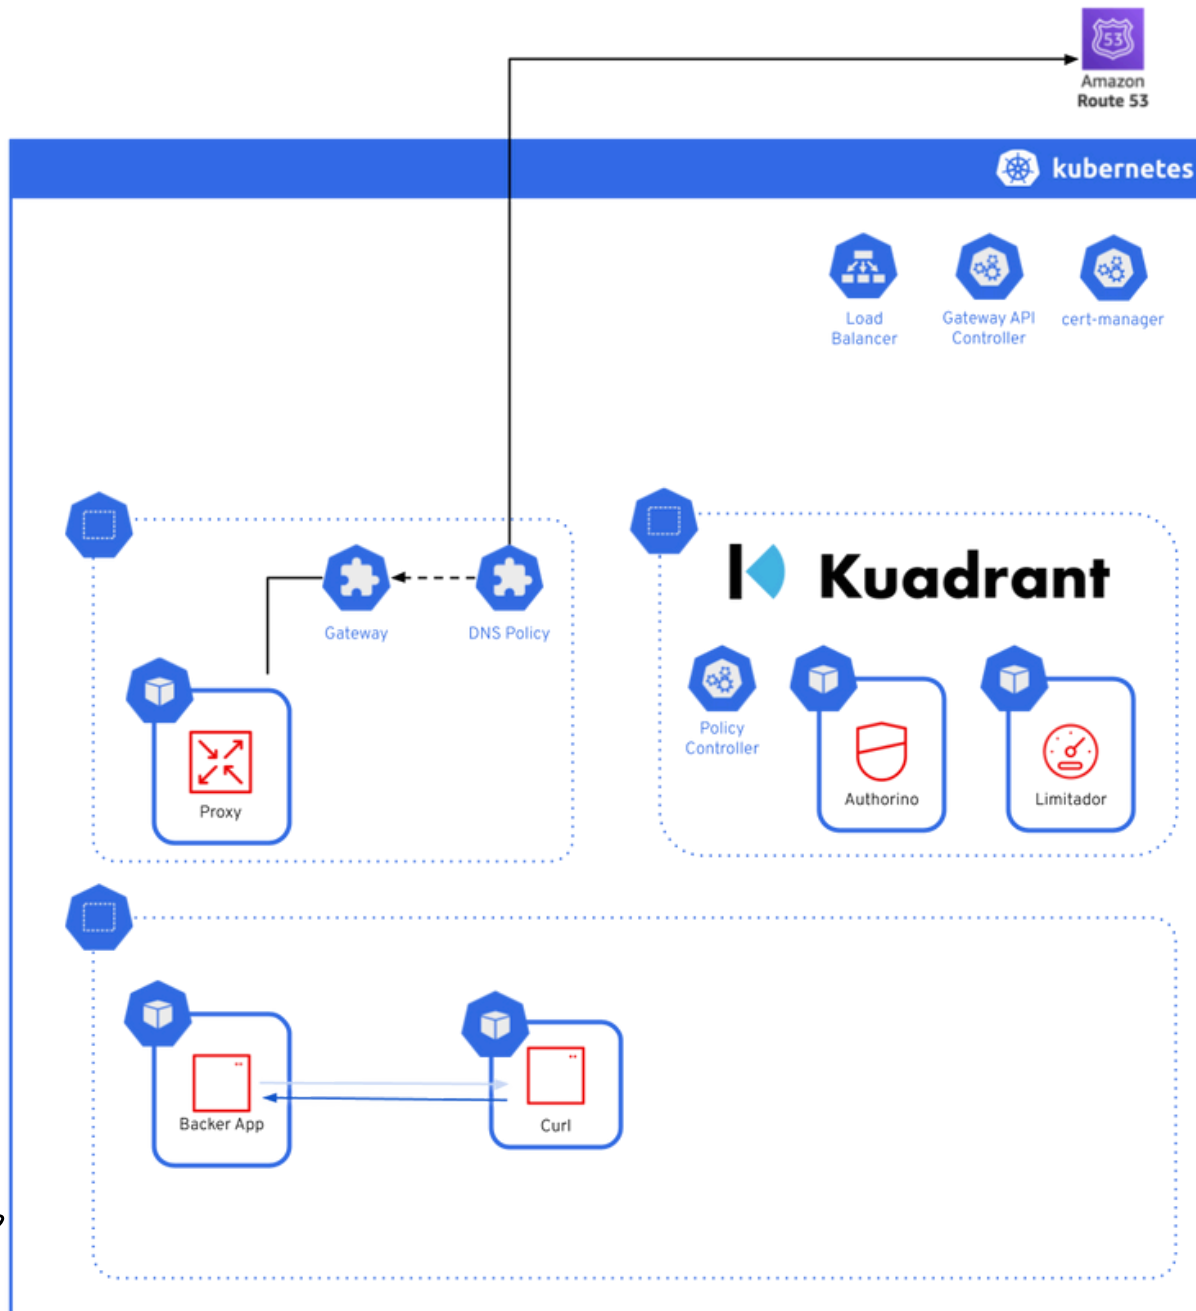

# Configure Ingress Gateway

In the meantime, I'm finishing configuring an **ingress gateway** that will be used to route the **traffic to the services**.

So now, I can focus on the gateway configuration.

This gateway is going to be a centralised point of connectivity and policy enforcement for the data plane.

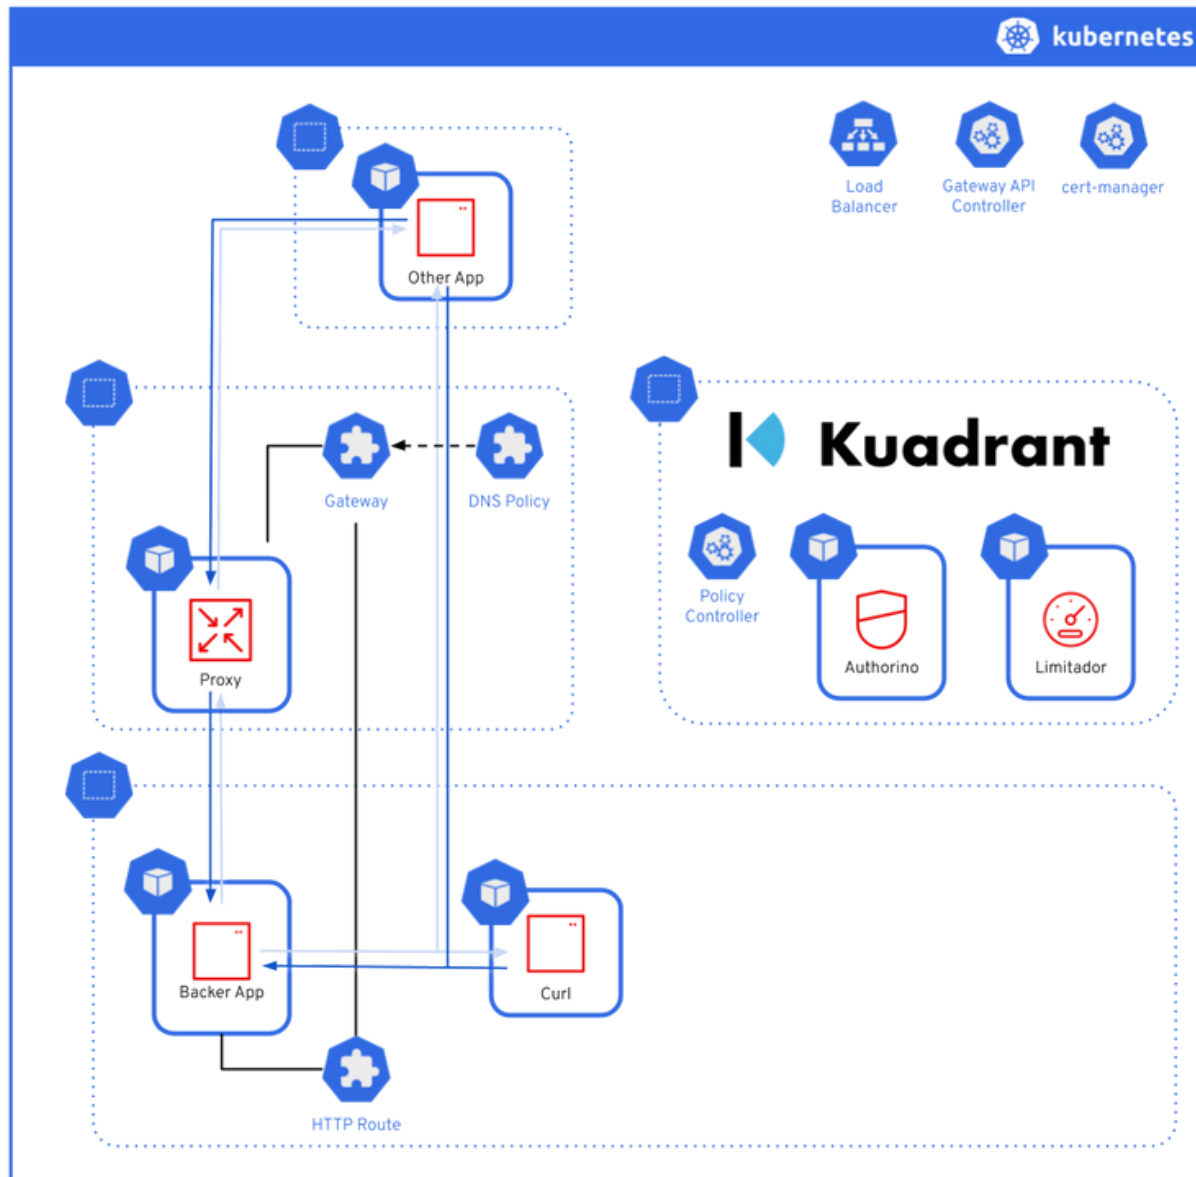

# Connecting to the Gateway

Ana, I'm going to give you **permission** to read the **status** of this **gateway**, so you can see when it's ready and grab some connectivity info you may need for your local tests.

Thanks! ✨  
I see the gateway is **programmed**. I'm going to **attach a route** to it.

# Securing the Gateway

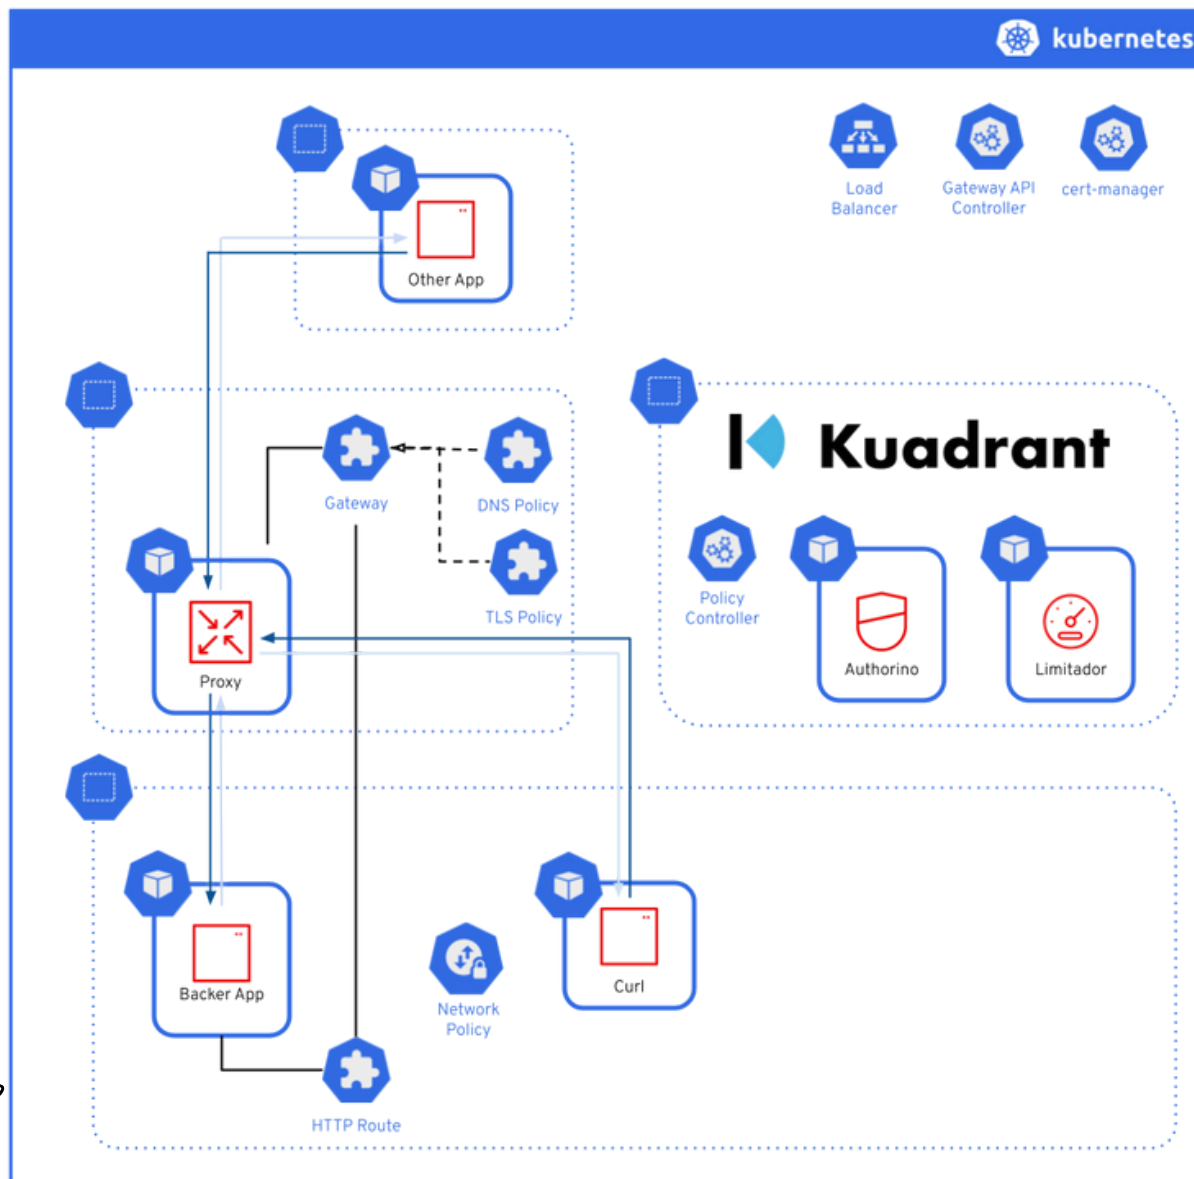

Thanks for the heads up. I've also seen in the **HTTPRoute Status** that there is a **DNS Policy** affecting it.

I've applied a **NetworkPolicy** so all the traffic goes through the ingress gateway.

That's right, here's the host name:  
**cupcakes.demos.kuadrant.io**

# Authenticated Traffic

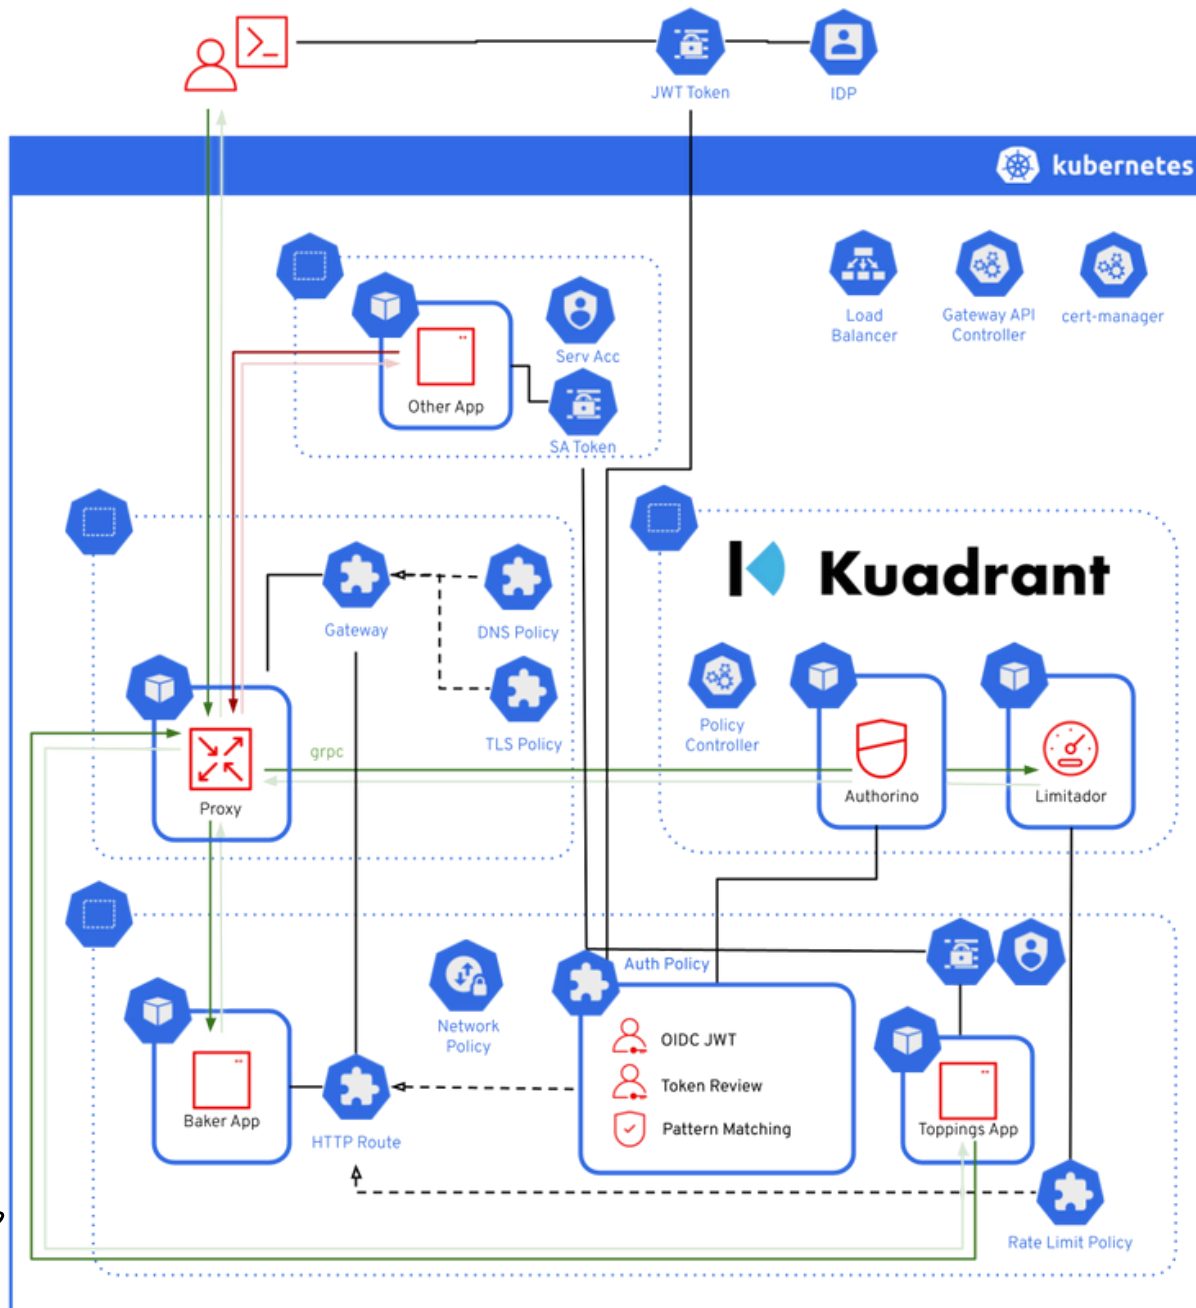

So I've attached an **AuthPolicy** to **deny all traffic**, feel free to attach one to your route to replace it and thus enforce auth as needed.

Ok, I'll setup 2 **authentication** methods, **OIDC** for **external** traffic and **K8S tokens** for pod **internal** traffic. I'll also create a **RateLimitPolicy** too.

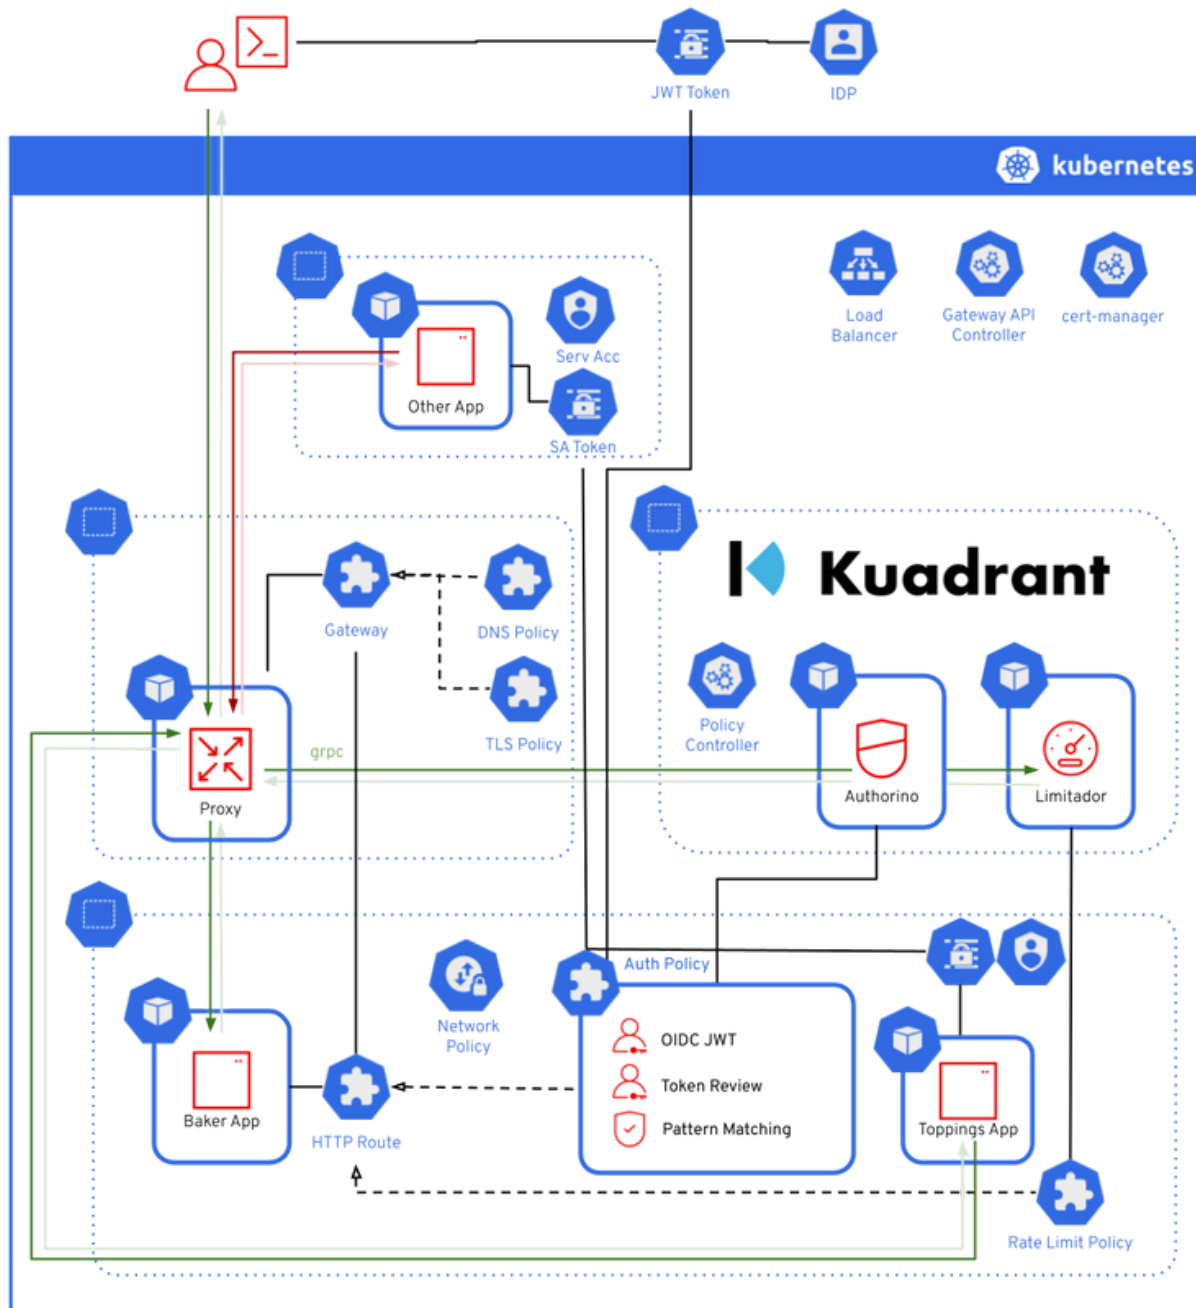

# Rate limiting

I've seen in the **HTTPRoute status** that there is another **RateLimitPolicy** in the **Gateway** affecting my rules.

Ah, yes, we've monitored more traffic that we can manage, I had to **override** yours
