

# Speaking Through Policies

#### **Personas**

#### Infra Provider

## Cluster Operator

## App Developer

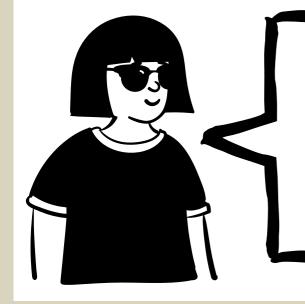

#### **Ana: App Developer**

I work with Chihiro at Evil Genius Cupcakes, where I am an **App Developer**.

My team **writes, deploys and maintains** software on **Kubernetes**, that the employees of our company use to operate the production of cupcakes.

Recently, I worked on the latest version of our "baker" **service**, which is ready to be deployed to **staging**.

#### Chihiro: Cluster Operator (aka Platform Engineer)

I work with Ana at **Evil Genius Cupcakes**My team **maintains** the **platform** where Ana **deploys** her apps.

We set up **ingress gateways** that route the traffic to the services.

We configure the top connectivity and security of the gateways (e.g.: DNS, TLS certs, etc).

We also ensure that some company-level **policies** are being **enforced**.

#### Ian: Infrastructure Provider

I work for the company "Infra 4 bakers" providing **K8S** clusters with batteries included, ready for their use. Including **Gateway API** and **Kuadrant** 

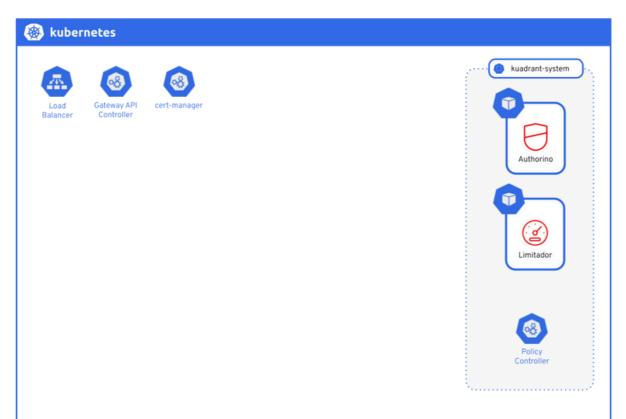

#### Cluster Ready

Our Infrastructure provider, Ian, span up this cluster for us and installed a **gateway controller** in advance.

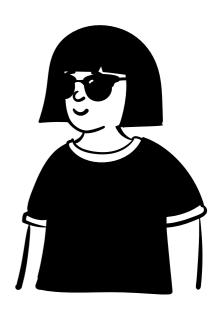

#### **Deploy Baker Service**

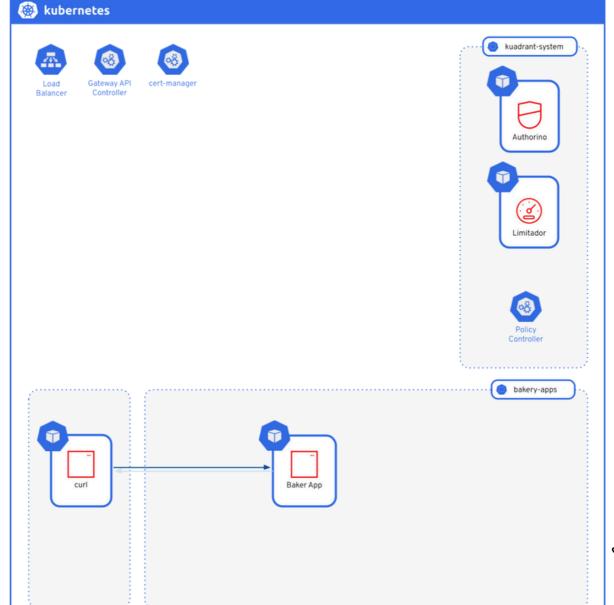

My work depends on Chiriro's a little, because the **gateways must be there**, but once they are, we're very **autonomous** regarding how we **deploy** the apps and **roll out new versions**.

We have a **namespace** where we configure the apps.

This is typically done via automation integrated with our code repositories, but today I will be demoing my day-to-day using the **kubectl CLI** tool.

In fact, I am about to **deploy** the `baker` service I mentioned before.

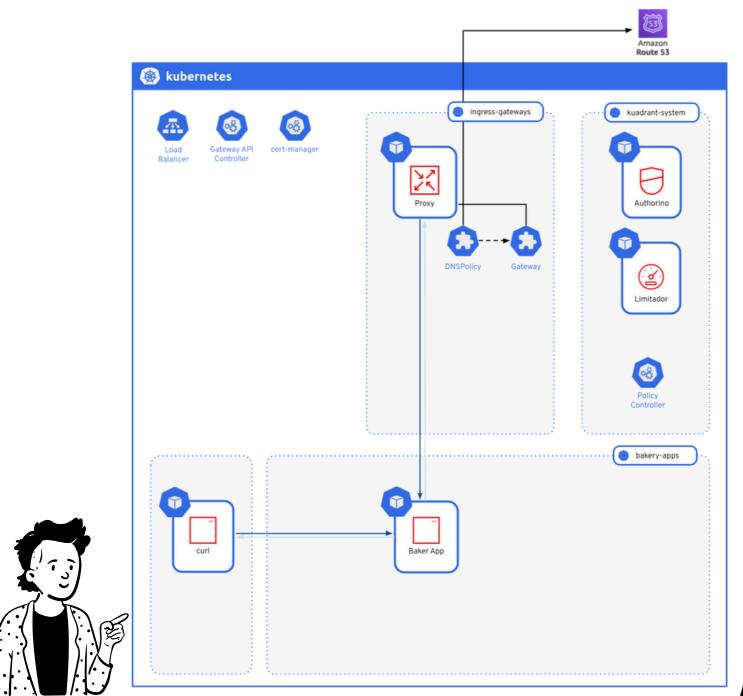

## **Configure Ingress Gateway**

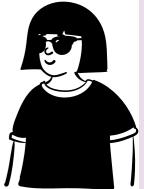

In the meantime, I'm finishing configuring an **ingress gateway** that will be used to route the **traffic to the services**.

So now, I can focus on the gateway configuration.

This gateway is going to be a centralised point of connectivity and policy enforcement for the data plane.

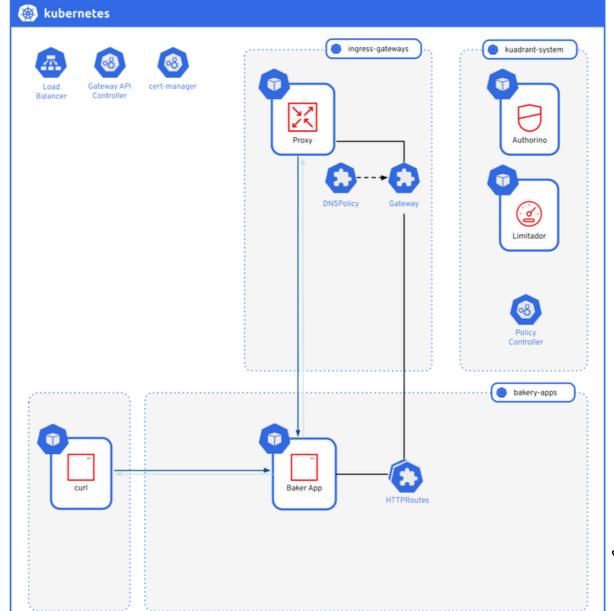

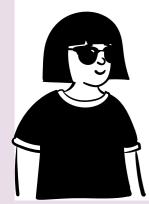

### Connecting to the Gateway

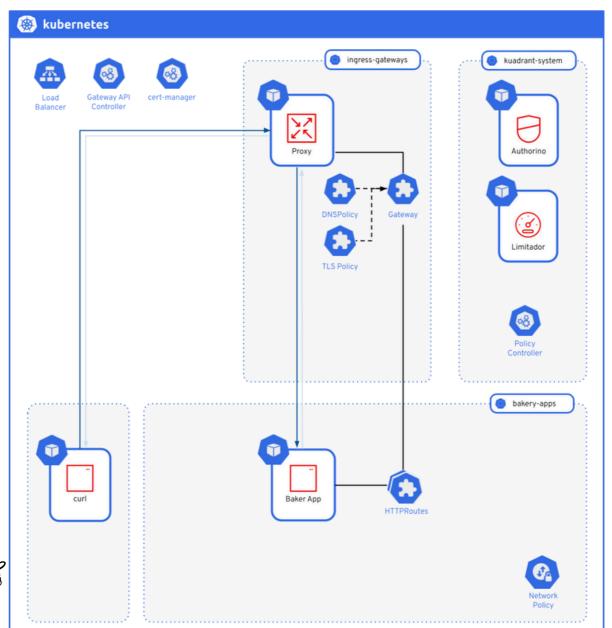

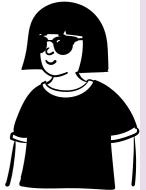

### Securing the Gateway

I've realised we might have traffic within the cluster hitting your apps directly. We need a **NetworkPolicy** so all the traffic goes through the ingress gateway.

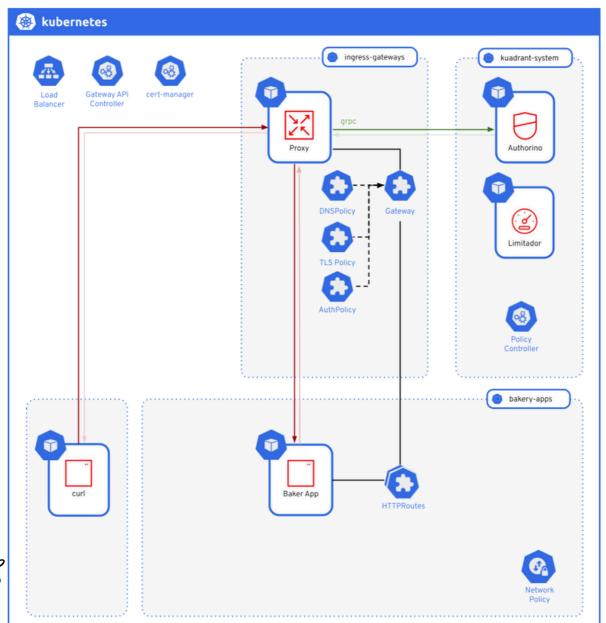

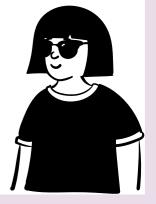

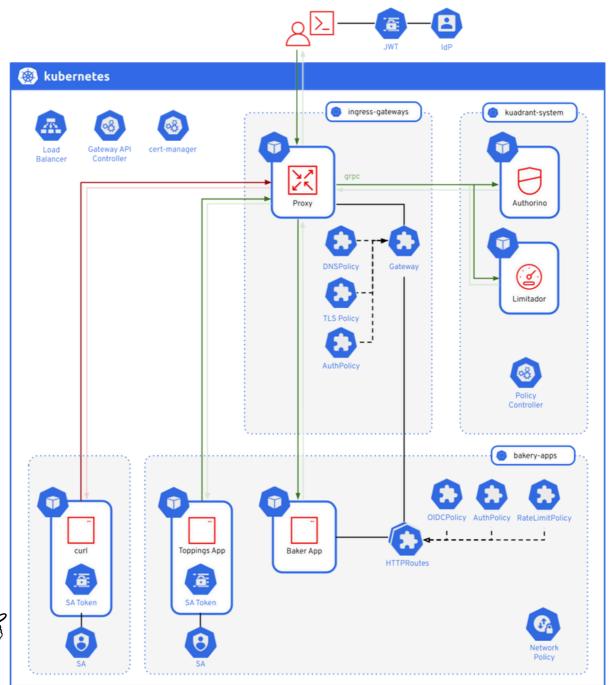

#### **Authenticated Traffic**

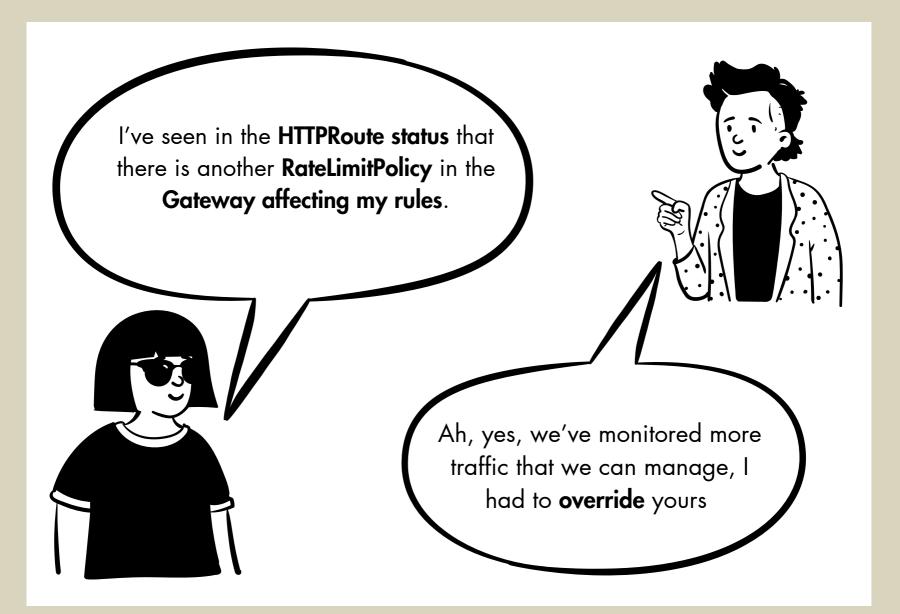

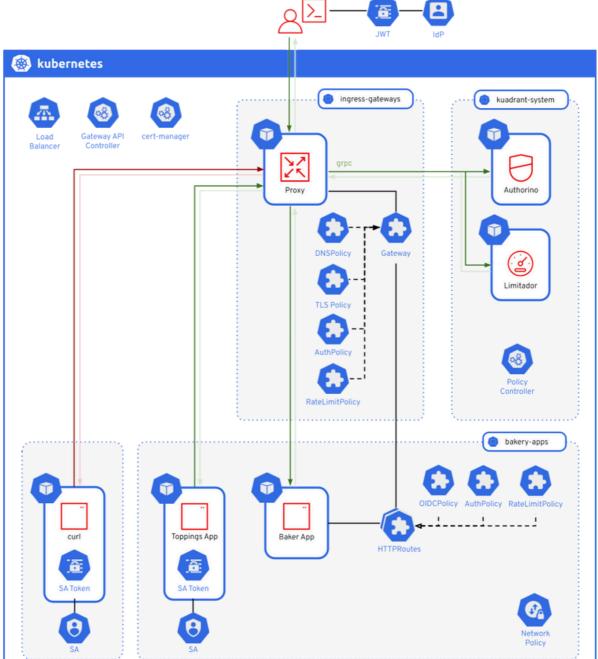

### Rate limiting
